Chapter 2 Basic Chemistry

Although it is possible to study anatomy without much reference to chemistry, chemical reactions underlie all body processes—movement, digestion, the pumping of your heart, and even your thoughts. This chapter presents the basics of chemistry and biochemistry (the chemistry of living material), providing the background you will need to understand body functions.

Concepts of Matter and Energy

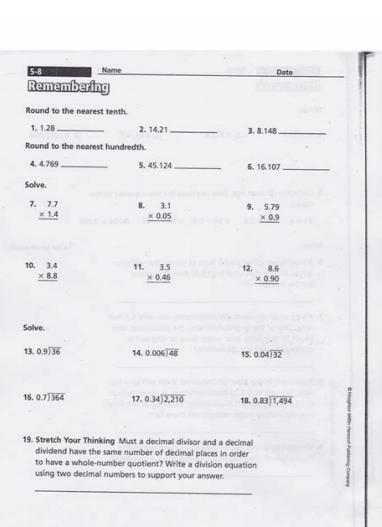

- Differentiate clearly between matter and energy.
- **Matter** – anything that occupies space and has mass (weight)
- **Energy** – massless and does not take up space – can only be measured by its effects on matter – the ability to do work or to put matter into motion
- List the four forms of energy provided as examples of how energy form is used in the body.
- **Chemical** – stored in the bonds of chemical substances; breaking bonds releases energy
- **Electrical** – results from the movement of charged particles (ions) typically across a membrane
- **Mechanical** – directly involved in moving matter – muscles moving bones
- **Radiant** – travels in waves (electromagnetic spectrum) – includes X rays, infrared, light, radio, and UV waves – retinas in our eyes react to light energy

Composition of Matter

- Define **chemical element** and list the four elements that form the bulk of body matter.
- Unique substances that cannot be broken down into simpler substances by ordinary chemical means
- Carbon, oxygen, hydrogen, nitrogen make up 96% of body weight
- Explain how elements and atoms are related.
- **Atoms** are the building blocks of elements
- Because all elements are unique, the atoms of each element differ from those of all other elements – change the atom, change the element
- List the subatomic particles and describe their relative masses, charges, and positions in the atom.
- **Protons** – positive charge, found in nucleus, heavy mass (1 atomic mass unit)
- **Neutrons** – neutral charge, found in nucleus, heavy mass (1 atomic mass unit)
- **Electrons** – negative charge, found orbiting outside nucleus, mass is so small it equals zero
- Define **radioisotope** and describe briefly how radioisotopes are used in the diagnosis and treatment of disease.
- **Half-life isotopes** of certain atoms are unstable and tend to decompose to become more stable
- They are used in tiny amounts to tag biological molecules so that they can be followed, or traced, through the body such as in PET scans.

Molecules and Compounds

- Recognize that chemical reactions involve the interaction of electrons to make and break chemical bonds.
- Define **molecule** and explain how molecules are related to compounds.
- Form when two or more atoms combine chemically
